Understanding the power of dynamic dashboarding

MercerRx Dynamics

MercerRx Dynamics provides actionable data you can access every day. From answering a quick question on the current cost of a drug product to determining areas for policy action, having your program's cost and utilization at your fingertips will allow you to make the decisions necessary for providing efficient care to your members.

Case study | Policy change implications

When contemplating a change to a prior authorization policy, one client was able to utilize our managed care organization (MCO) formulary utilization dashboard to determine the impact.

MercerRx Dynamics enabled a **quick** and **efficient** review of the current drug utilization along with the ability to model the effect the entire program change would have on each MCO. The modeling provides views of multiple options for the potential change. **MercerRx Dynamics** reduced the time to evaluate the impact by having the information at the fingertips of the client. Both pre- and post-policy change implications are able to be determined using **MercerRx Dynamics**.

Case study | Legislative request

Frequently, a state legislature will request information on utilization of a drug or therapeutic category when considering upcoming legislation or questions from constituents.

MercerRx Dynamics offers a simple format for answering these questions by providing overall trends in utilization, filterable by multiple categories to allow the user to drill down to the individual drug level or review utilization at the aggregate level. Standard filtering includes time designations, drug classification, and state-specific program levels along with calculated metrics such as total paid, total claims, cost per claim, and many others.

Case study | Review of societal influence on utilization

When confronted with community level influences, such as the COVID-19 pandemic or other more local influences, MercerRx Government's clients need to **quantify** the impact these influences are having on their Medicaid programs.
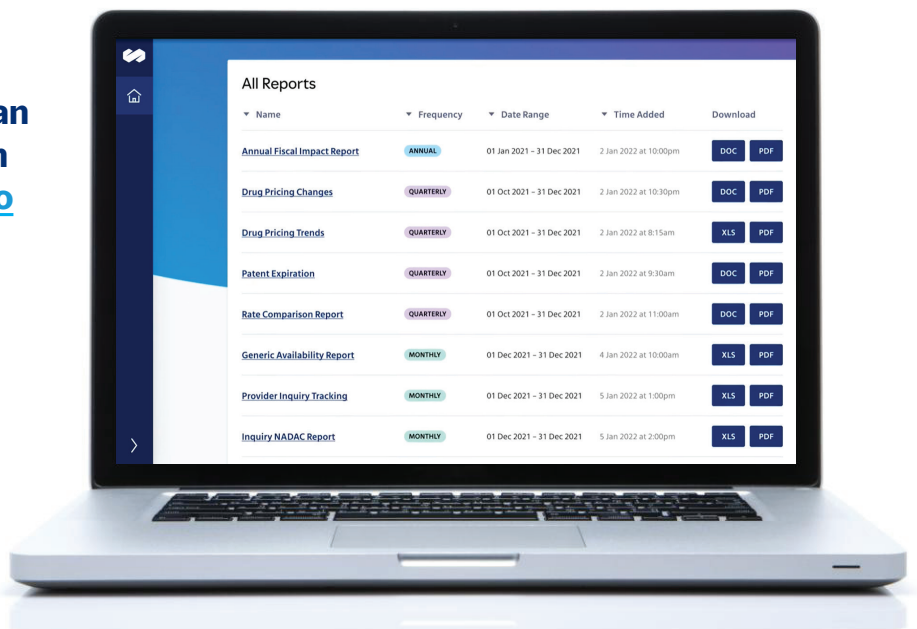

A recent client was able to **track** the changes their pandemic-related policies were having on their pharmacy program and **monitor** the effect that rapid changes to potential therapies was having on individual drug utilization.

The client was able to maintain agility in their program by keeping a pulse on the changes caused by the outside influences.

Whether you are monitoring the effect of a recent policy change or ensuring compliance by pharmacy Medicaid managed care plans, having the right data readily available is key. The pharmacy health care landscape can change at any time. The current landscape is influenced not only by the latest high cost drug to hit the market, but also by budgetary considerations, policy changes, federal and state administration objectives, or patient quality of care initiatives. **MercerRx Dynamics** will give you access to your program's utilization data and keep you up-to-date on the effect these changes are producing. Mercer is focused on delivering an enhanced experience which allows you to manipulate and interact with your data, gain insights into trends, and turn those insights into actionable outcomes.
